

DIESEL EXHAUST CASE STUDY *HOSE REEL SOLUTION*

UPS, in their ongoing commitment to employee health & safety, installed a vehicle exhaust removal system. With a fleet of over 1,500 vehicles rotating through their service center, a durable solution was required.

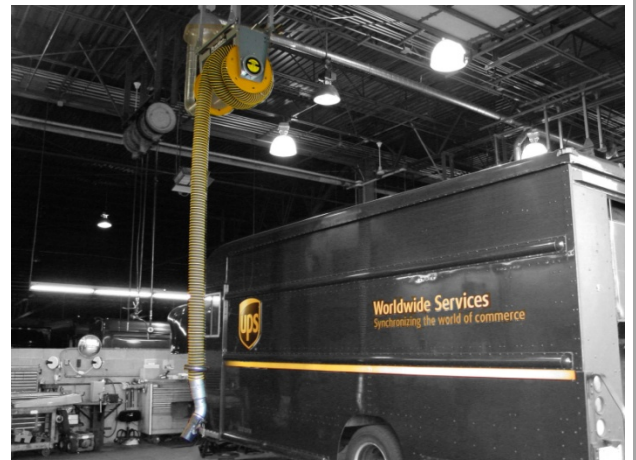

Clean Air Company installed (3) PlymoVent spring operated hose reels equipped with auto start micro switches and high temperature hose. The employees simply pull the hose down off the retractable hose reel and the fan activates automatically.

The hose reels were mounted 16 feet overhead so not to obstruct vehicles from entering the building or being placed on lifts. The hose storage capacity of the reel allows one hose reel to service two bays. Exhaust fumes are captured at the tailpipe using the PlymoVent REG style nozzle which universally fits all vehicle tailpipes. The exhaust fumes are transported through a central duct system and vented directly outdoors.

Clean Air Company has been specializing in the design and installation of vehicle exhaust removal systems since 1989. Sampling of customers includes PSE&G, NJ Turnpike, NY City Department of Transportation, NY City Department of Sanitation, United States Postal Service, Fort Dix, Fort Totten, and NJ Department of Transportation.

For additional information on the hazards of exhaust emissions or product information contact the Clean Air Company.
